What is Slidev?

Slidev is a slides maker and presenter designed for developers, consist of the following features

-  **Text-based** - focus on the content with Markdown, and then style them later
-  **Themable** - theme can be shared and used with npm packages
-  **Developer Friendly** - code highlighting, live coding with autocompletion
-  **Interactive** - embedding Vue components to enhance your expressions
-  **Recording** - built-in recording and camera view
-  **Portable** - export into PDF, PNGs, or even a hostable SPA
-  **Hackable** - anything possible on a webpage

AndroidManifest.xml

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android" package="...">
  <application android:allowBackup="true"
    android:icon="@mipmap/ic_launcher" android:label="@string/app_name"
    android:roundIcon="@mipmap/ic_launcher_round" android:supportRtl="true"
    android:theme="@style/AppTheme">
    <service
      android:name=".MessagingService"
      android:exported="false">
      <intent-filter>
        <action android:name="com.google.firebase.MESSAGING_EVENT" />
      </intent-filter>
    </service>
    <activity android:name=".MainActivity">
      <intent-filter>
        <action android:name="android.intent.action.MAIN" />
        <category android:name="android.intent.category.LAUNCHER" />
      </intent-filter>
    </activity>
  </application>
</manifest>
```

```
public class MessagingService extends FirebaseMessagingService {
    @Override
    public void onMessageReceived(RemoteMessage message) {
        ...
    }

    @Override
    public void onNewToken(String token) {
        ...
    }
}
```

iOS

mobile-cicd

Pipeline cover:

- Automatically running unit tests
- Automatically running integration tests
- Automatically running static code analysis checks
- Automatically running debug/release builds
- Automatically distribute the app for testers
- Adding Gitlab’s drop-in features
- SAST
 - Dependency management
 - License management
 - ...

OWASP Mobile Application Security

The OWASP Mobile Application Security (MAS) flagship project provides a security standard for mobile apps (OWASP MASVS), a list of common security and privacy weaknesses specific to mobile apps (OWASP MASWE) and a comprehensive testing guide (OWASP MASTG) that covers the processes, techniques, and tools and test cases to deliver consistent and complete results.

- Architecture & Design
- Authentication & Authorization
- Data Storage & Privacy
- Network Communication
- User Interface
- Code Quality
- Application Integrity
- Post-Deployment
- Platform-Specific Guidance

Templates

- Android.gitlab-ci.yml
- Android-Fastlane.gitlab-ci.yml
- iOS-Fastlane.gitlab-ci.yml

Stages

```
stages:
  - environment
  - build
  - test
  - internal
  - alpha
  - beta
  - production

include:
  - template: Dependency-Scanning.gitlab-ci.yml
  - template: SAST.gitlab-ci.yml
  - template: License-Management.gitlab-ci.yml
  - template: Secret-Detection.gitlab-ci.yml
```

mobile-visual-testing

Types of Mobile Device Testing:

- **Functional Testing:** This testing verifies whether the device's basic features work correctly. For example, in the case of a mobile device, it involves ensuring that functions like making calls, sending text messages, and web browsing work as expected.
- **Performance Testing:** Performance testing examines how the device handles different scenarios. When testing a device, multiple apps running simultaneously or using a slow Internet connection can be evaluated to assess the device's performance under various conditions.
- **Usability Testing:** Usability testing focuses on how easily users can interact with the device. In the context of a device, it typically includes giving users tasks to complete and observing how they interact with the device.
- **Compatibility Testing:** Compatibility testing ensures that the device functions correctly with a variety of operating systems, networks, and other devices. In the case of a device, this testing can encompass connecting it to different Wi-Fi networks or Bluetooth devices to verify compatibility.
- **Localization Testing:** Localization testing validates that the device is adapted to different languages and cultures. In the context of a device, this entails checking if menus and text display correctly in the relevant language.
- **Accessibility Testing:** Accessibility testing make sure that the device can be effectively used by individuals with impairments. For a device, this may involve checking its compatibility with screen readers and other assistive technologies.
- **Battery Testing:** Battery testing assesses the device's battery life and performance. In the case of a device, this often involves running various applications to gauge their impact on battery consumption.
- **Camera Testing:** Camera testing appraises the quality and performance of the device's camera. For a device, this typically includes capturing photos and videos under different lighting conditions to evaluate the camera's capabilities.
- **GPS Testing:** GPS testing verifies the accuracy and performance of the device's GPS system. In the context of a phone, it can involve using the device for navigation and assessing the precision of the provided directions.
- **Security Testing:** Security testing aims to uncover and rectify security vulnerabilities in the device and its applications. For a device, this may involve attempts to breach the device's security or install malicious software to assess its resistance to such threats.
- **Certification testing:** It is a process of evaluating a mobile device to ensure that it meets certain standards and requirements. This type of testing is typically performed by a third-party organization and is necessary for the device to be launched in the market.
